(54) TIRE AIR PRESSURE DETECTION DEVICE

(57) Abstract:

PURPOSE: To enable a tire pressure to be detected indirectly and improve its detection accuracy.

CONSTITUTION: A title item is provided with speed sensors 2 and 3 which output a signal according to a rotary speed of a tire and an electric control device 4 which performs a specified operation processing by inputting a signal from the speed sensors 2 and 3. The electronic control device 4 performs operation of a wheel speed based on an output signal of the speed sensors 2 and 3 and at the same time performs frequency analysis of the calculated wheel speed, and then calculates a resonance frequency of a spring lower part of the vehicle in up/down and forward/backward directions. Then, a state of tire pressure is detected based on the resonance frequency.
